Growing Season Weather Patterns Impact on Vine Hardiness

Kevin W. Ker, PhD

Professional Affiliate and Research Associate

Cool Climate Oenology and Viticulture Institute,
Brock University, St. Catharines ON Canada

KCMS Applied Research and Consulting, Fenwick ON Canada

Overview

- Cold hardiness of grapevines is the main limiting factor for growing grapes in Ontario
- Winter Injury is one of the greatest threats to the success of our industry
- Vine health and winter hardiness is directly influenced by the weather patterns of the growing season

Vine Hardiness

- Ability to withstand different freezing temperatures at different times of the year
- Concept of optimizing genetic potential versus increasing hardiness
- Influenced by many factors
 - Weather patterns (early, mid, and late season)
 - Crop loads
 - Inherent vine hardiness
 - Vine health

Cool
Climate
Oenology &
Viticulture
Institute

Brock University

Acclimation

- A reversible change in the morphology or physiology of an organism in response to environmental change

From Wine East 2001

How has the weather influenced this acclimation and hardiness

- Consider temperature and precipitation events throughout the season and during key periods
 - From Fruit Set to Veraison
 - From Veraison to Harvest (or Leaf Drop)

Cool

Brock University

How do most remember weather?

- **Most people remember 3 years of weather**

But not consecutively !

- **THE BEST YEAR**
- **THE WORST YEAR**
- **LAST YEAR**

Monthly Growing Degree Days (10C) Accumulation

2007 - “Dry Year / Hot Harvest”

- Cool/wet April followed by warm and dry May
- Relatively normal summer temperatures with lower than normal rainfall experienced
- Dry September followed by very warm October

2008 - “Dry Bloom / Wet Harvest”

- Typical spring temperatures and rainfall
- Dry June/July with relatively normal temperatures followed by a cooler August
- Very wet September and typical October weather

2009 - “Cool All Season - Late Long Year ”

- Wet and cool April followed by a relatively typical May
- Wet and cool June, July and August
- Dry September however temperatures remain cool throughout the fall

2010 - “Early Start & Early Finish”

- Relatively normal precipitation in April and May with higher than normal temperatures, EARLY START.
- Very wet and cool June however July and August dried out and warmed up
- Typical fall precipitation and temperatures

2011 - “Wet Spring, Dry July & Wet Fall”

- Extremely wet April & May with relatively normal spring temperatures experienced
- Slightly greater than average rainfall in June and August along with normal temperatures however, July was very hot and dry
- September and October were wet with a high frequency of rain events however temperatures were slightly above average

	Bud Break to Prebloom	Bloom to Fruit set	Fruit Set to Veraison	Veraison to harvest
2007	Dry, average Cold start	Dry Hot	Dry Average Temp	Dry Sept Warmer than Average
2008	Dry, average Cool and slow	Dry Warm	Average rain Average Temp	Wet Sept Average Oct Average Temp
2009	Wet Cool Slow	Wet Average temp	Wet to Very Wet Cool	Dry Sept Average Oct Cold October
2010	Dry, average Warm to bloom	Very wet Average temp	Moderate rain Warm	Average Sept and Oct Average temp
2011	Very wet Cold start	Dry Average Temp	Very dry (40 days) Very Hot July	Very wet Sept and Oct Average Temps

MERLOT

LTE50 Acclimation Curves 2009-2012

MERLOT

LTE50 De-Acclimation Rates (Jan 1 - May 1)

So What Have We Learned to Date?

1. Principle of Early to Bed - Early to Rise seems to be occurring. Fast acclimation and fast de-acclimation the next spring
2. Average or low precipitation periods from Veraison to Harvest result in a more rapid rate of acclimation and achievement of maximum hardiness
3. Chardonnay as a consistent level achieved for maximum hardiness regardless of prior season.
However....

So What Have We Learned to Date?

4. De-acclimation begins slowly in late January with a very rapid rate of de-acclimation during March
5. Based on 2011/12 winter data vines have remained extremely hardy despite the “Balmy Winter”
6. Average is for statistics. No two seasons are truly alike though very general values such as GDD may infer similarity
Vine hardiness development is influenced by much more.....

Bud Hardiness Data for Merlot at Four Mile Creek - 2011/2012

Sampling Date	LTE 10 ?	LTE 50 ?	LTE 90 ?
January 4, 2012	-18.4°C	-22.4°C	-24.1°C
December 21, 2011	-16.6°C	-19.4°C	-21.3°C
December 2, 2011	-13.9°C	-17.9°C	-19.9°C
November 8, 2011	-11.7°C	-15.2°C	-16.8°C
October 19, 2011	-6.3°C	-10.3°C	-12.3°C

Change to °F

An example of how to read this data:

As of **January 4th**, according to estimates:

- If temperature drops below -18.4°C, 10% of primary buds will die.
- If temperature drops below -22.4°C, 50% of primary buds will die.
- If temperature drops below -24.1°C, 90% of primary buds will die.

NOTE: Your individual situation will vary by numerous factors.
